

XTTRACT™ For Dairy Cows

A NEW GENERATION RUMEN MODIFIER

Xtract 6965 is a patent pending product containing selected plant extracts contained within a micro-encapsulated protective matrix. This enhances stability, ensures a good palatability status and optimises efficacy of the active components.

◆ **KEY BENEFITS – PRODUCTION**

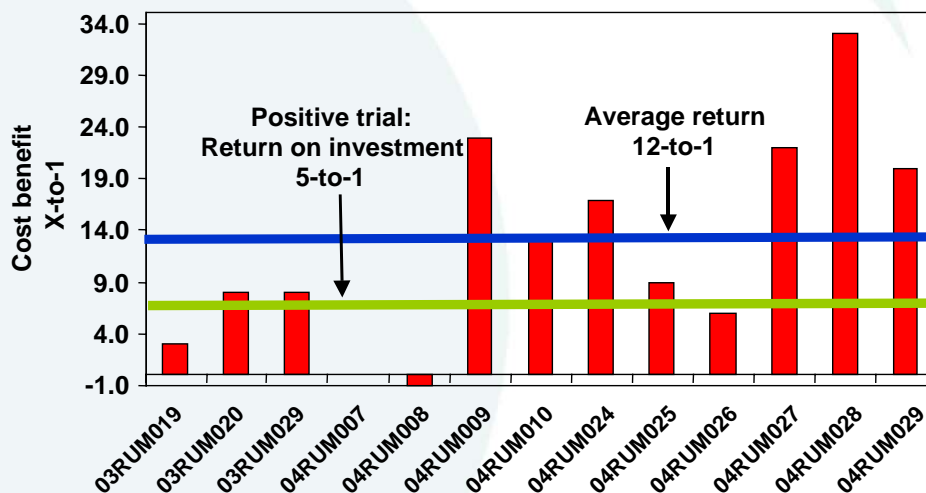

The most important observed effects on nutrient metabolism are changes to the acetic and propionic acid ratios and a reduction in the levels of ammonia nitrogen.

As a consequence an average increase in daily milk production of 1.5 kg was observed in the trials carried out on commercial farms in the USA and Europe.

◆ **KEY BENEFITS – ECONOMIC**

A baseline of a Return on Investment of 5:1 was the target of the research team. However an average of 12:1 was achieved in practise when Xtract was fed during the first 100 days of lactation.

Summary table of milk production results from trials conducted in monitored field trials and university trial stations in Europe and North America from June 2003 to December 2004

Xtract is suitable for adding to a wide variety of rationing systems ranging from compound feeds to on farm direct fed supplements. The recommended feeding rate is 375 – 500 mg / cow / day.

Full details are available in an interactive technical CD dossier and product brochure.
